With GWP® Recommendation:
- You purchase only equipment with the right accuracy to meet your process and quality requirements
- You take into account environmental and regulatory factors before the selection

GWP® Recommendation is globally available for free and can be issued for any METTLER TOLEDO balance or scale.

You have downloaded a specimen highlighting the scientific selection of a balance or scale based on your process requirements. GWP® Recommendation provides documented evidence that the instrument selected meets metrological, environmental and regulatory requirements.
Readability (display resolution) of a balance or scale often is mistaken for accuracy. As a matter of fact, readability is just one contributor to the measurement uncertainty, which is the scientific expression of an instrument’s accuracy. To ensure accurate measuring, you must consider at least the following factors prior to the selection of a new balance or scale:

1. Customer information
2. Instrument information
3. Weighing requirements and achievements: Color codes pinpoint accuracy and safety factor
4. Appropriate test weights and weight classes
5. Detailed explanations and remarks
