Block: FB3 Wait For Calibration Complete

This Subroutine is called from the "Calibration_Procedure" routine whenever it kicks off a calibration step (such as Capture Zero, Capture Span, or Capture Span2 if Linearity is Enabled). The "Calibration_Procedure" routine will then wait until this subroutine indicates that the step is complete. A status is returned on the success or failure of the step, and on what failed (if anything).

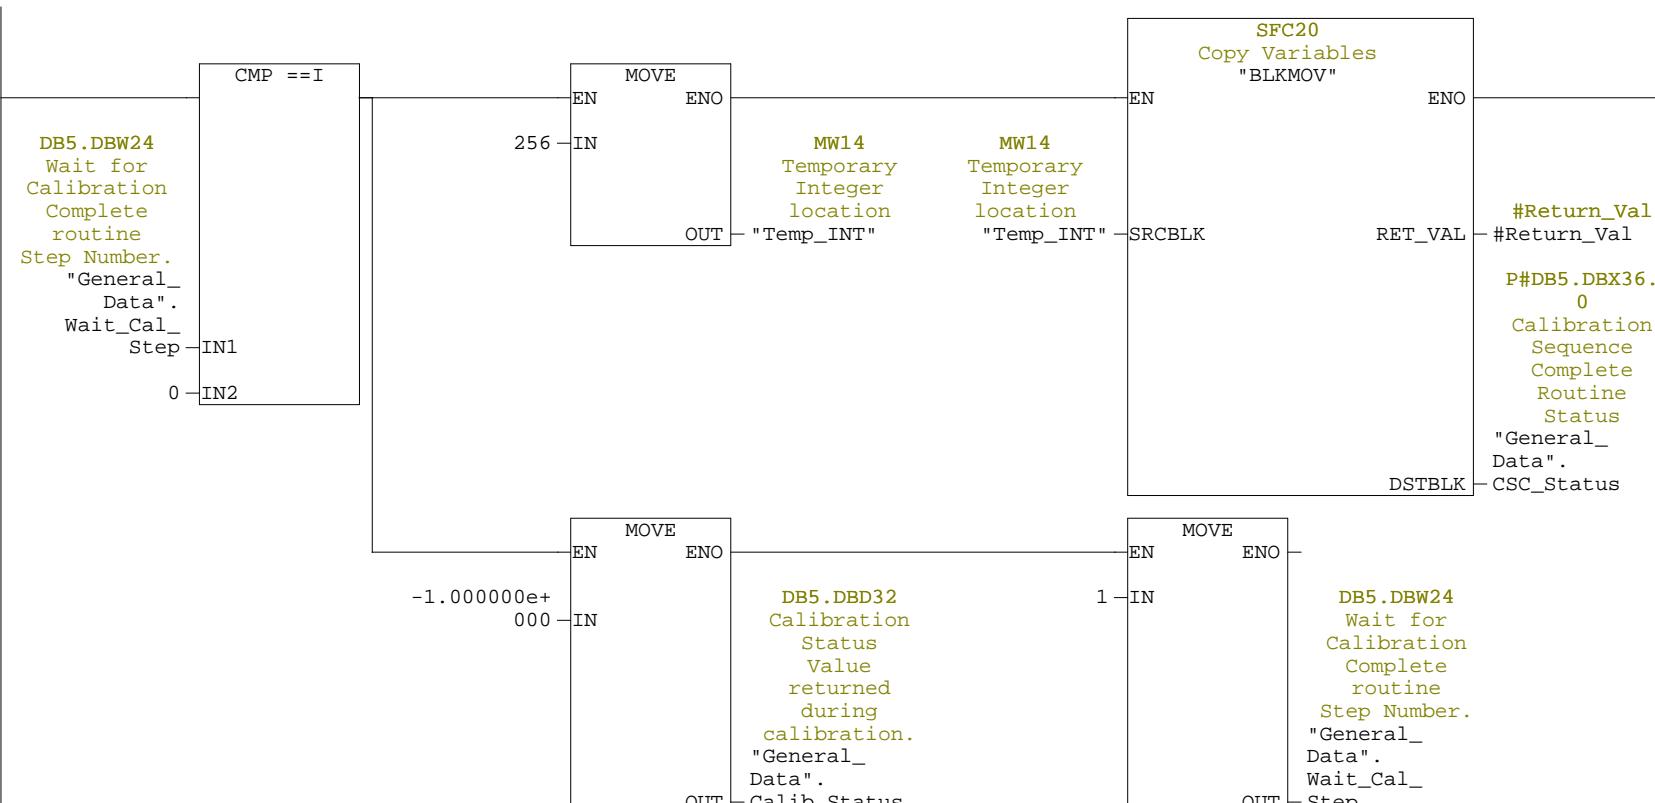

Status values returned are:

- Motion Detected During Calibration Step
- Time Out
- Data OK bit did NOT turn OFF

Note that we make use of the Command_Acked bit (set in the MainRoutine when a change in the Command Ack bits is detected) in this routine to drive the steps.

Network: 1 Initialize the Wait procedure.

1. Initialize the Calibration Step Complete (CSC) Status to show that its running.
2. Initialize the Calibration Status (Calib_Status) so that we know when a real value comes in.
3. Initialize the Sequence Step (Wait_Cal_Step) to kick off the whole process.

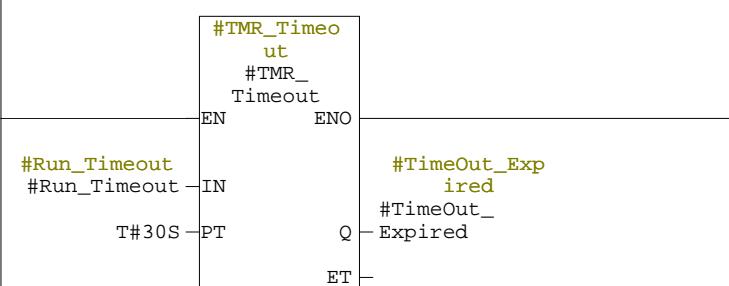

Network: 2 Timeout Timer Run Logic

While the Data OK bit is OFF, run a Timeout Timer that limits how long we'll wait before flagging an Error Condition.

```
DB4.DBX7.7
Scale okay
for normal
operation.      DB5.DBX36.0
"Cyclic_        "General_
Data".          Data".
Scale_          CSC_Status.
Status.         Run_Timeout_
Data_OK         Timer
                                         #Run_Timeout
                                         #Run_Timeout
```

Network: 3 Timeout Timer

Network: 4 Timeout Timer Expired

Handle Setting the flags to indicate when the timeout timer expires

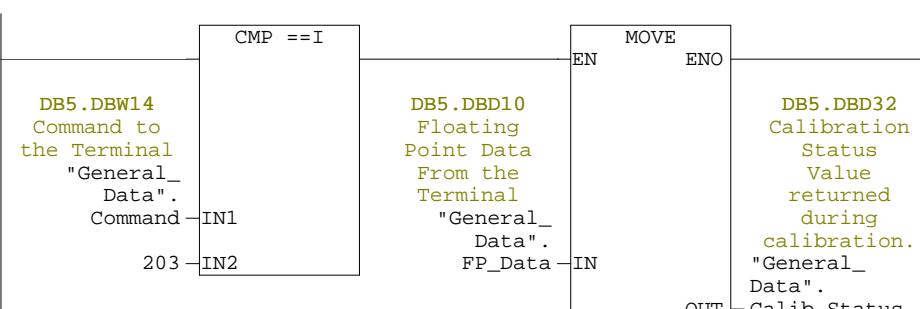

#TimeOut_Ex

DB5.DBX36.3
"General_ Data".
CSC_Status.
Calibration_ Step_Failed

DB5.DBX36.1
"General_ Data".
CSC_Status.
Step_Timed_ Out

Network: 5 Get Status Value

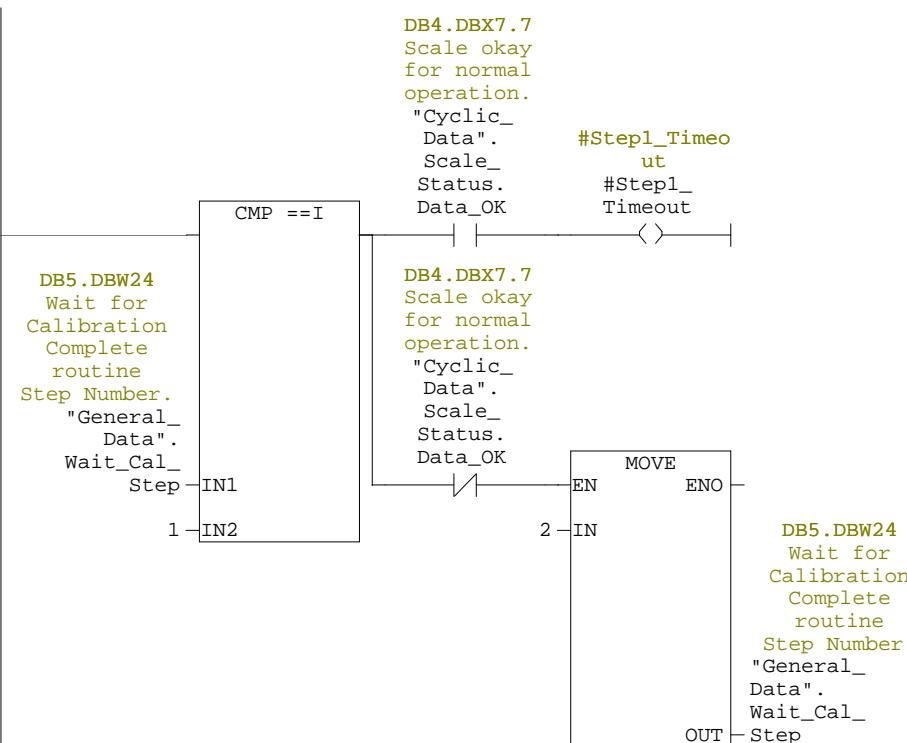

If the Command is set to return the Calibration Status, get the Calibration Status.

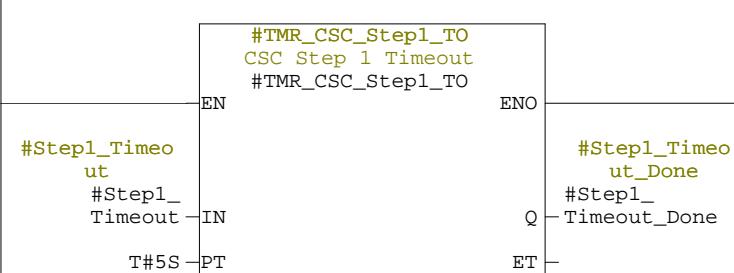

Network: 6 Wait for the Data OK to turn OFF

Make sure that the Data_OK bit is OFF before moving on to step 2.

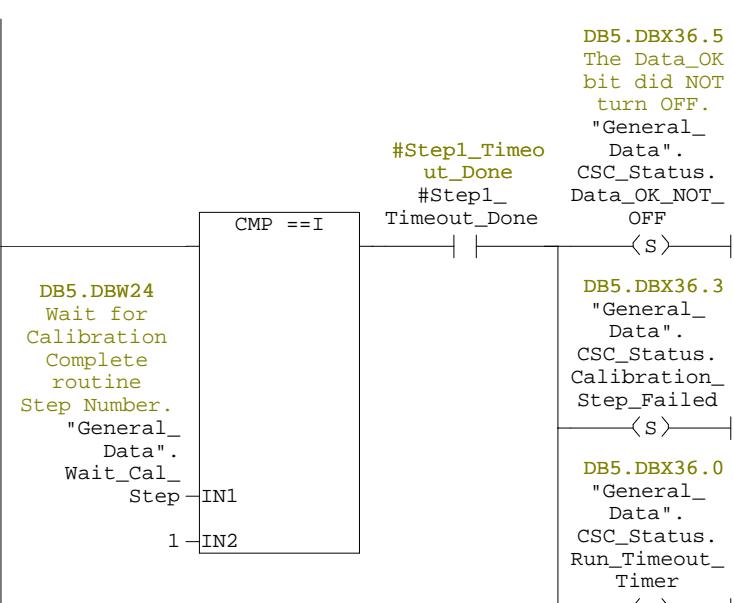

If the Data_OK bit doesn't turn off eventually, then set an alarm bit and terminate this routine.

Network: 7 Step 1 Timeout Timer

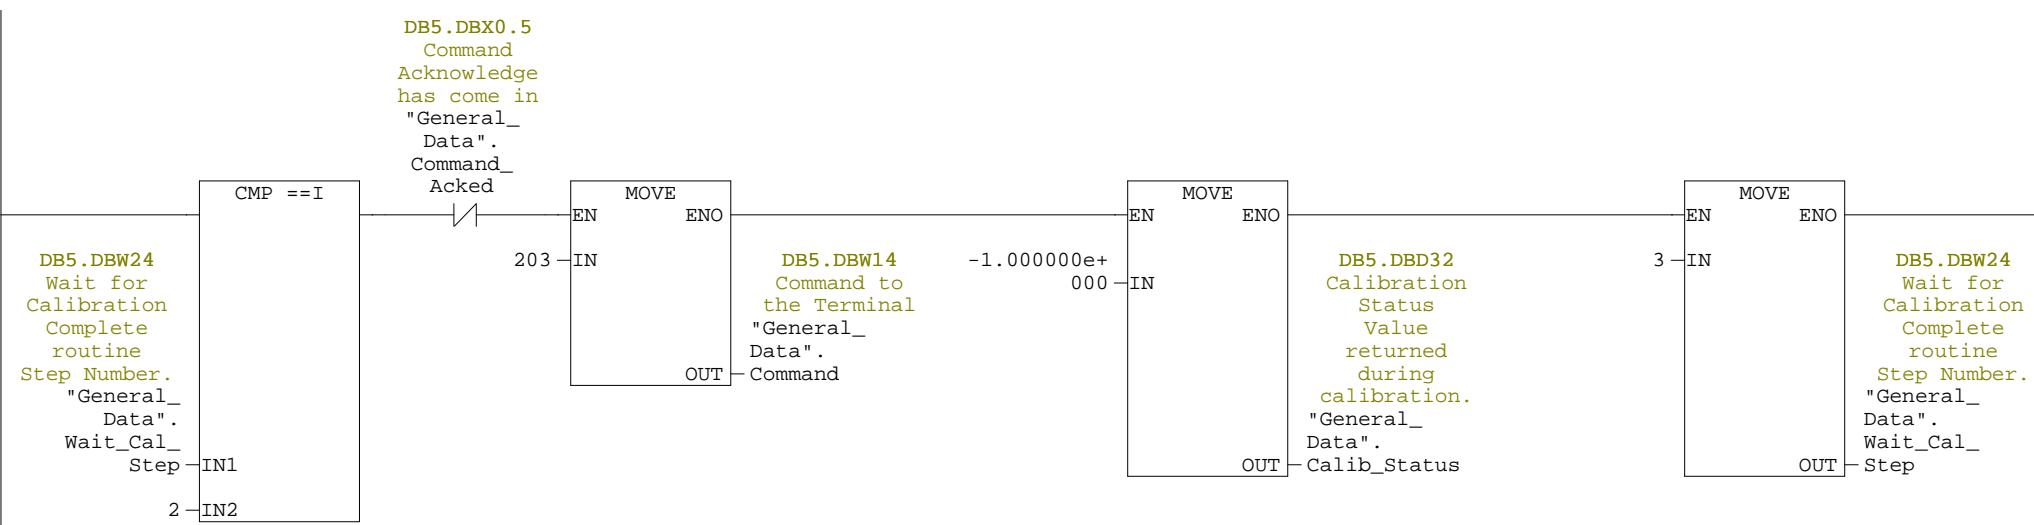

Network: 8 Step 1 Timeout Expired

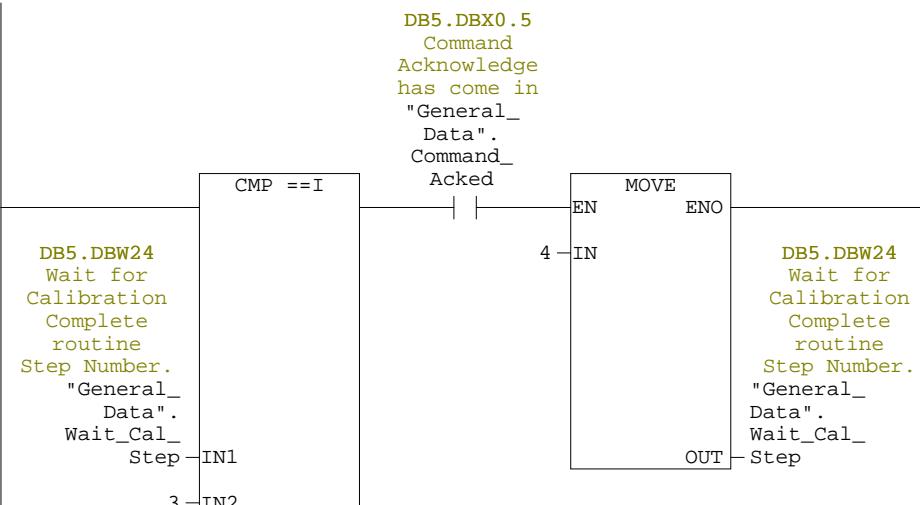

Network: 9 Return Calibration Status

Issue the command to return the Calibration Status (203)

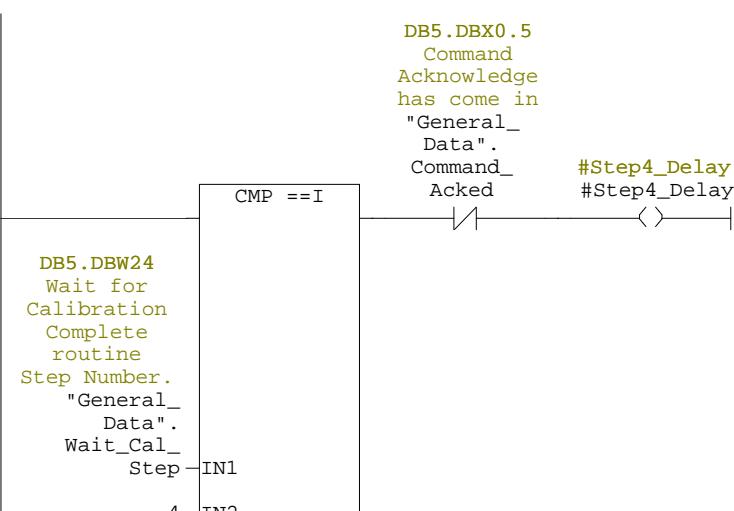

Network: 10 Wait for the 203 command to be Acknowledged

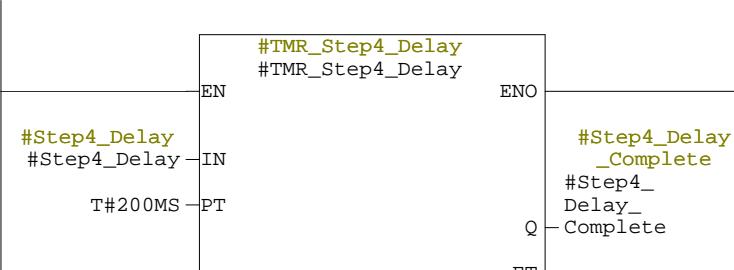

Network: 11 Update Delay

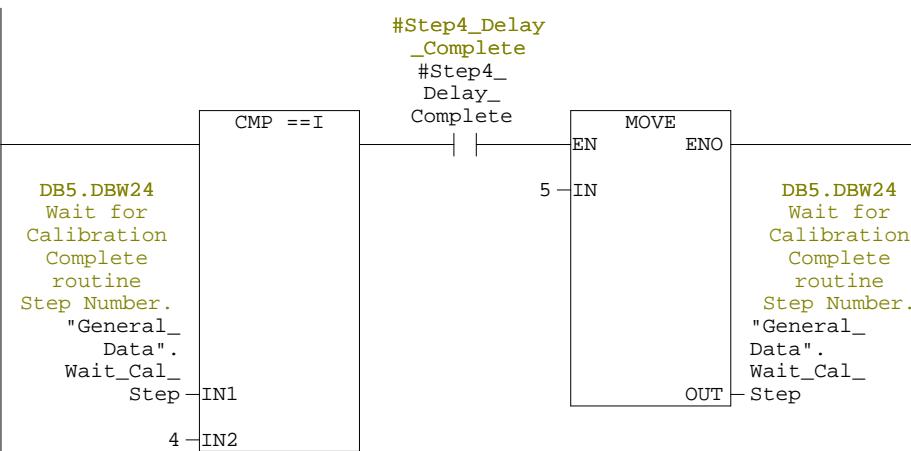

Give the Terminal a little time to update the buffer before attempting to act on the results.

Network: 12 Step 4 delay

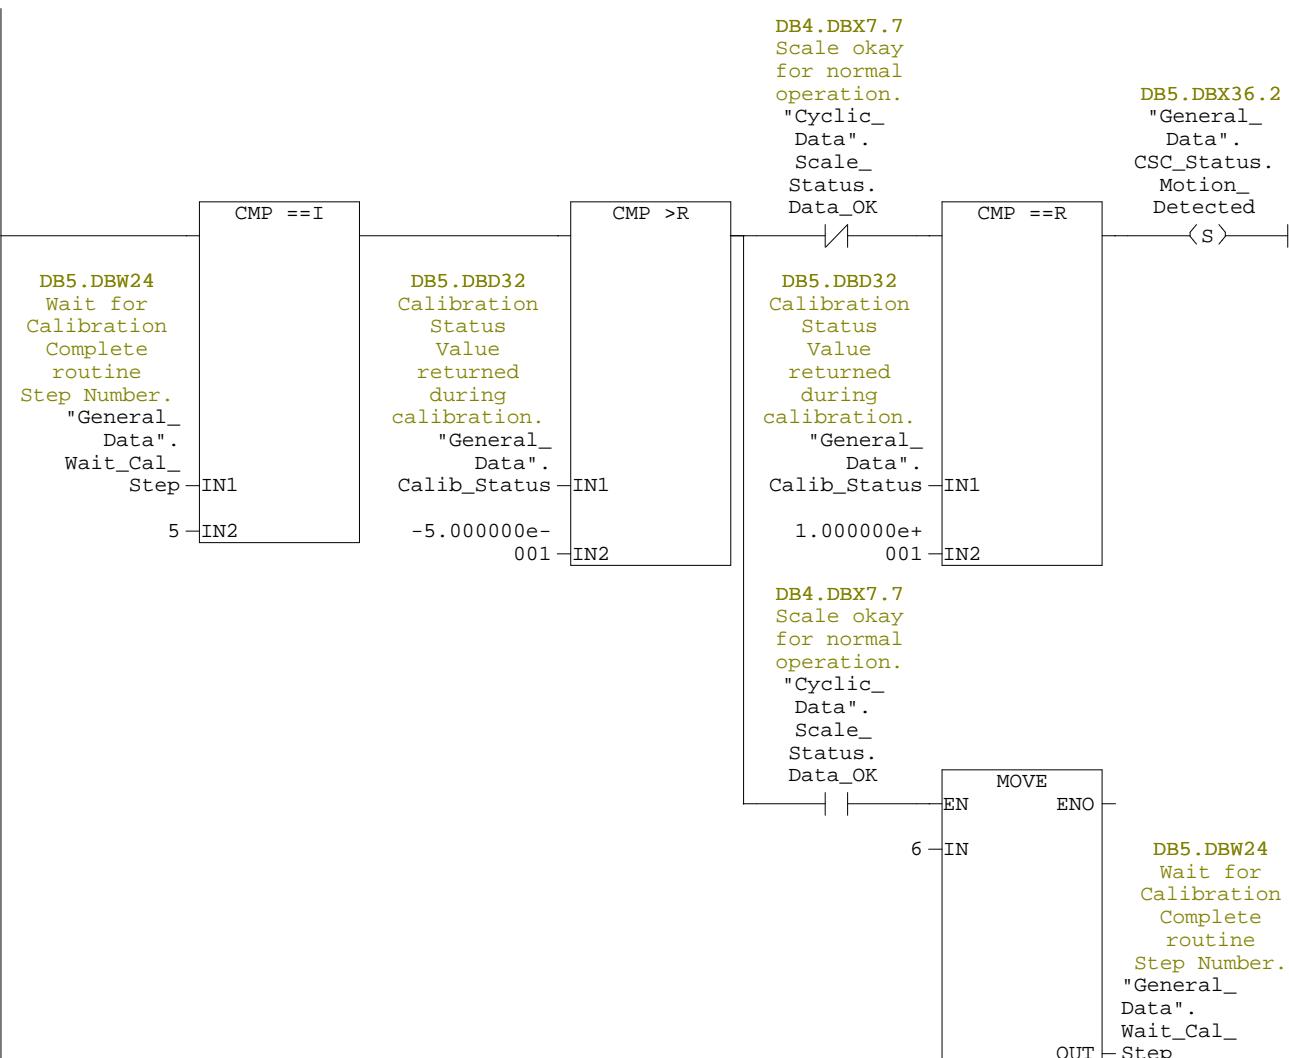

Network: 13 Step 4 Delay complete.

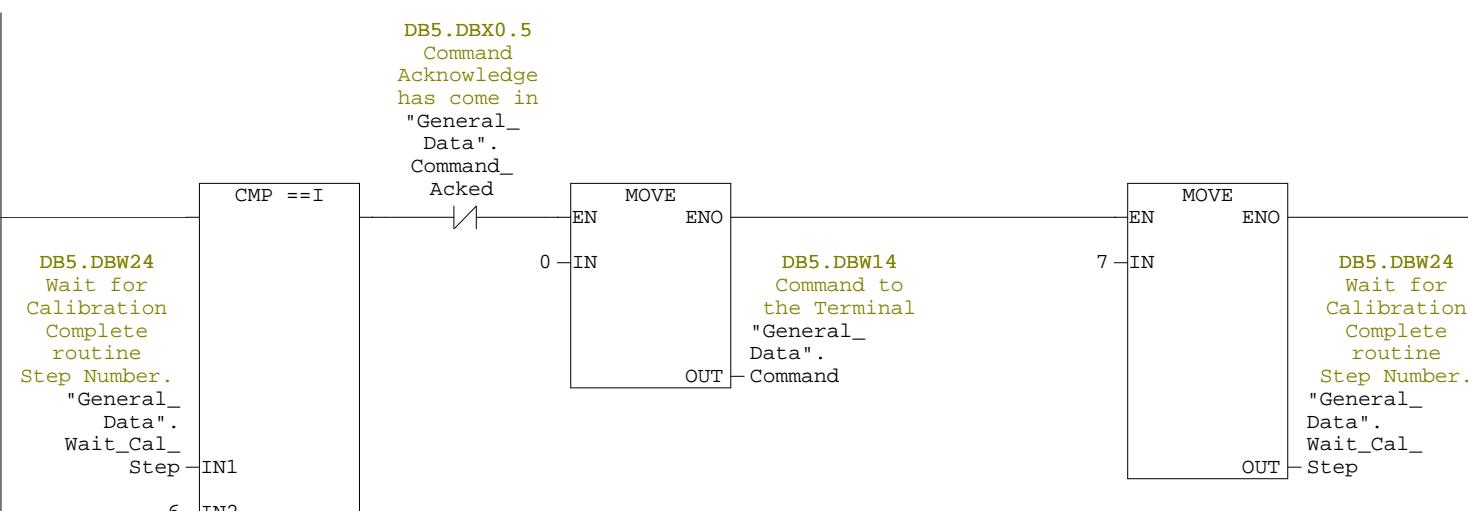

Network: 14 Motion Check

While the Data OK bit is off, look for a value of 10.0 to be returned, which indicates that there is motion on the scale. If a 10 is found, set the motion flag.

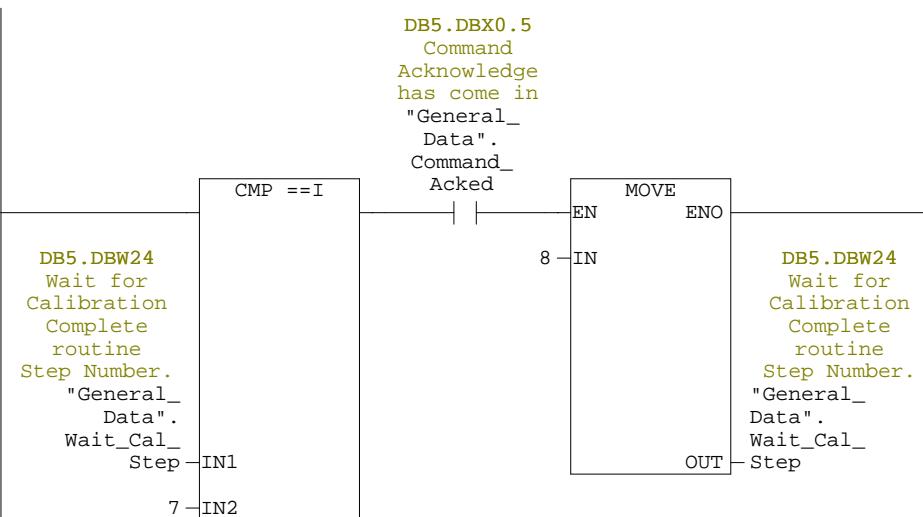

Network: 15 Issue Command Zero

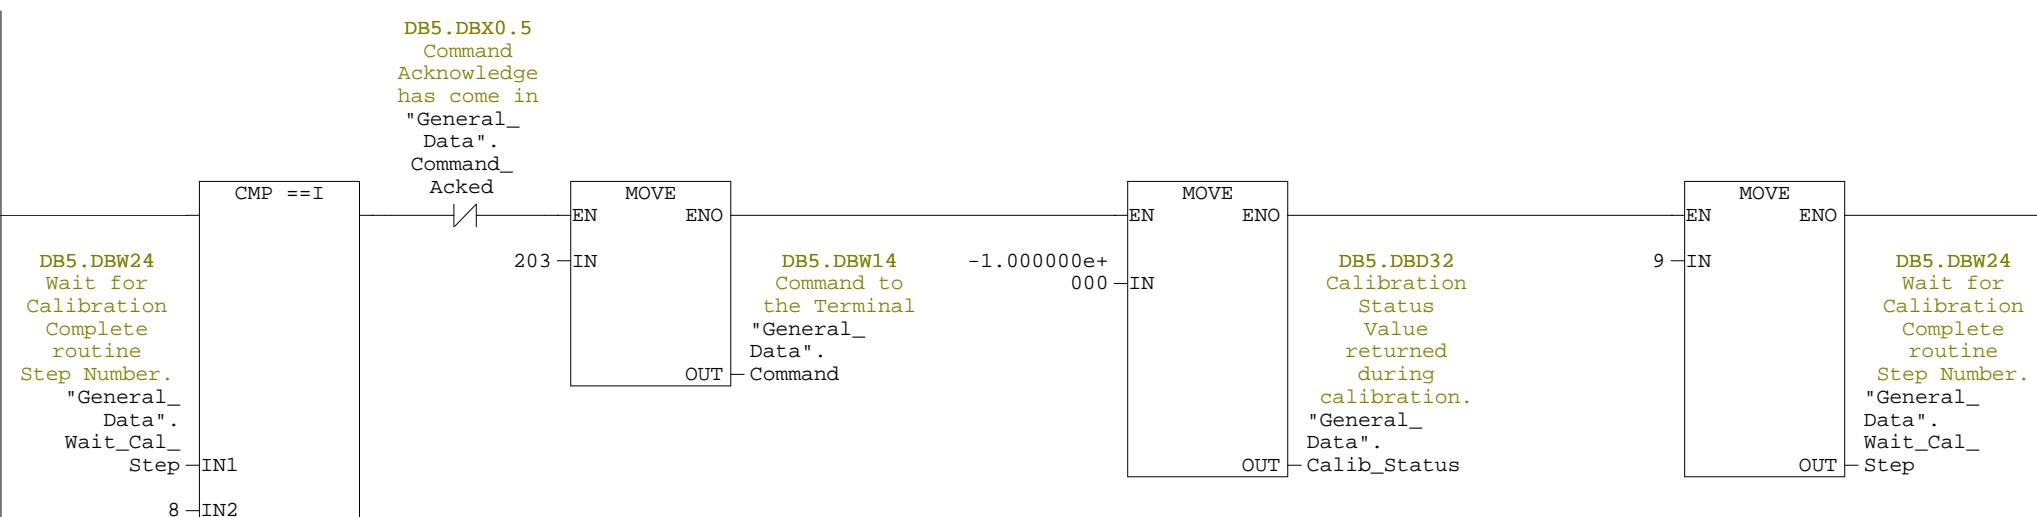

We need to re-issue the 203 command after the Data OK bit comes back on to get the final status of the calibration. To do that, we first have to change the command in the buffer so the terminal will see the new issue of 203. So, issue a command 0 here.

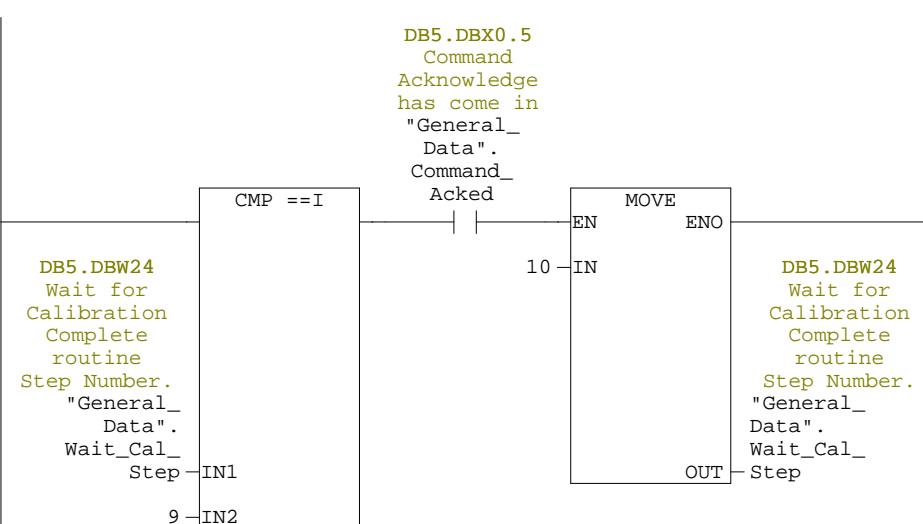

Network: 16

Network: 17

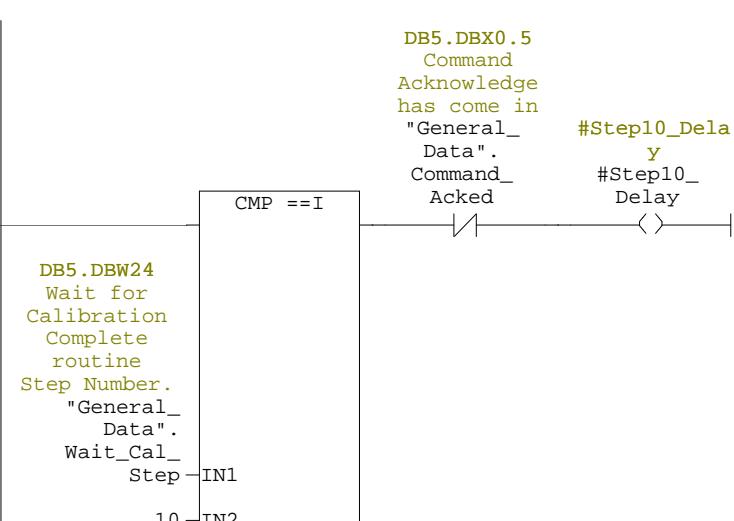

Network: 18

Network: 19 Read Delay

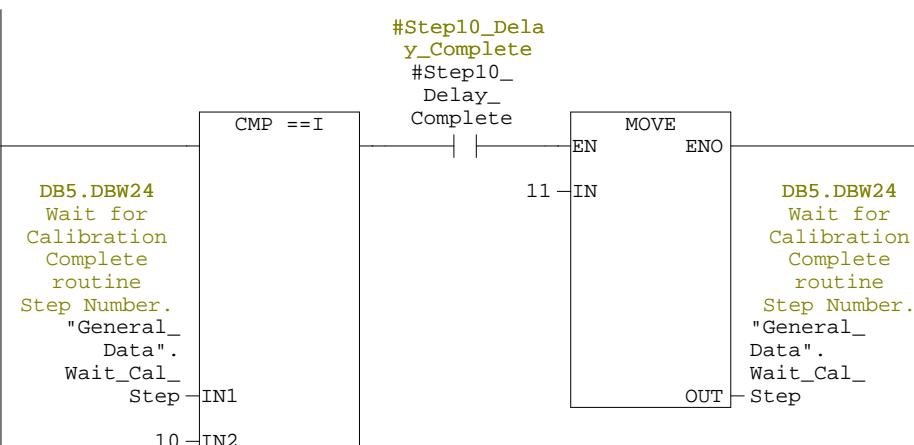

Give the terminal a little time to update the value before trying to read it.

Network: 20 Step 10 Delay

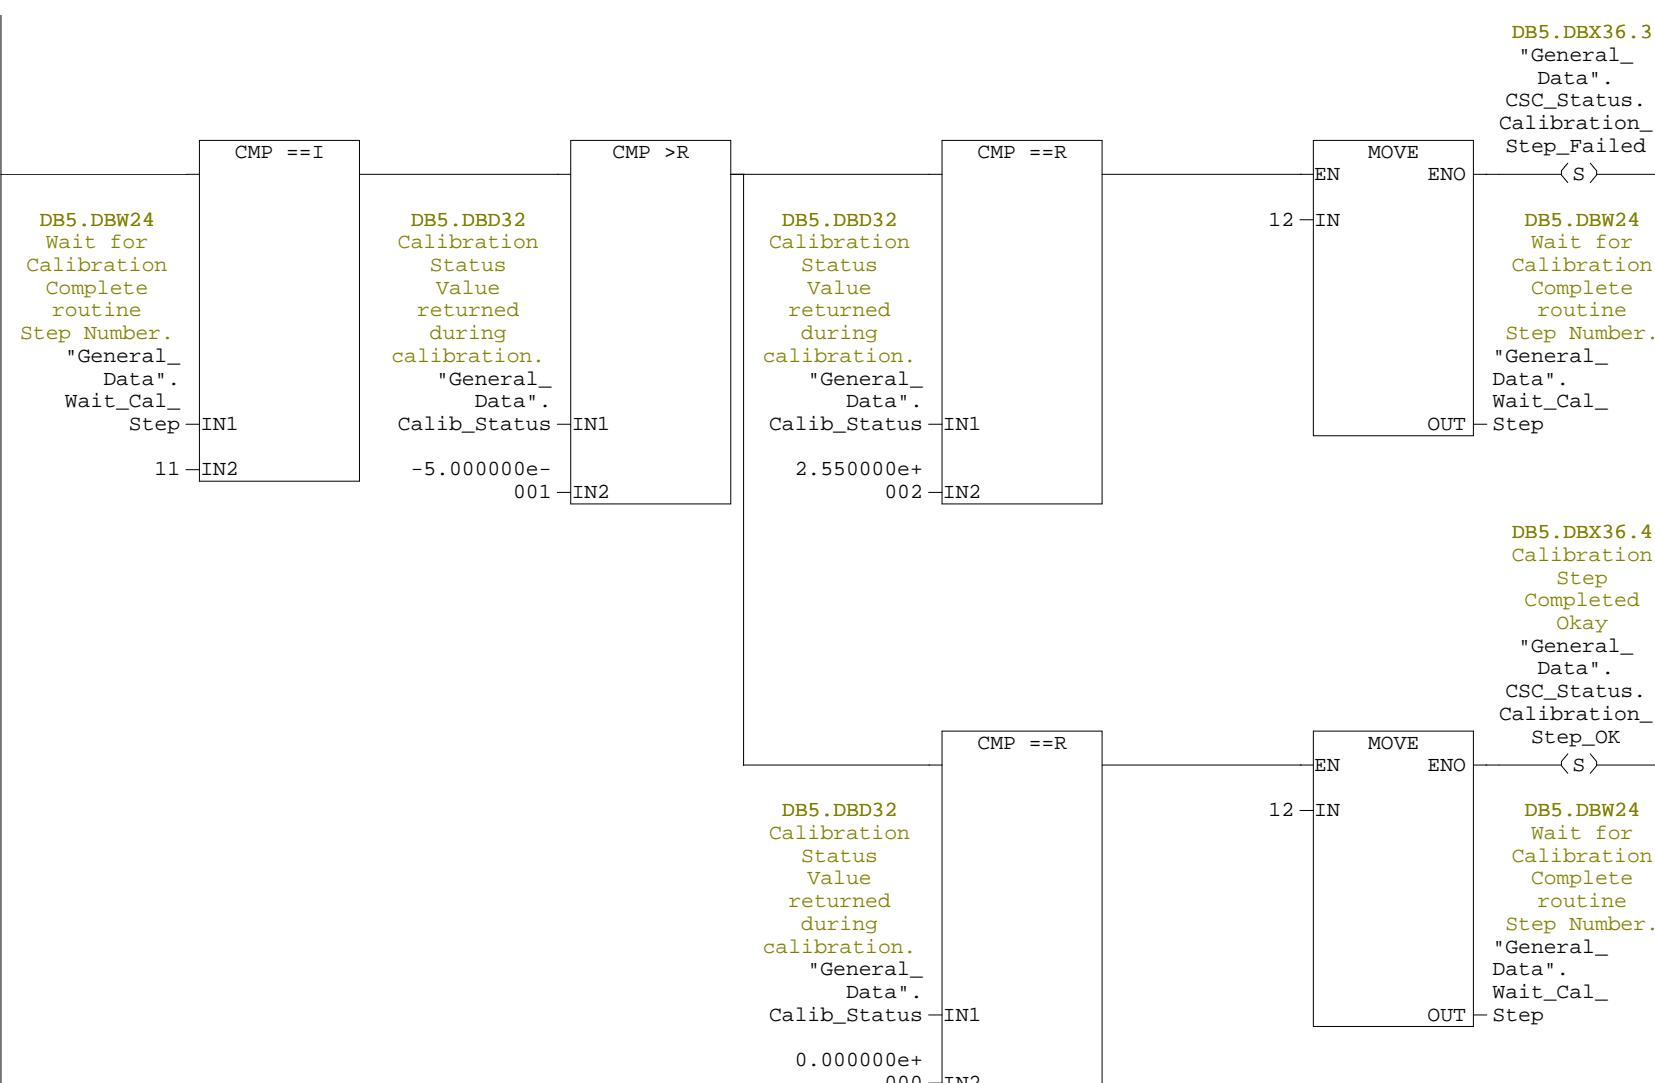

Network: 21 Step 10 Delay Complete

Network: 22 Update the calibration status bits

Update the calibration status bits based on the returned status value from the terminal.

Network: 23 End of routine
